

LIVE Webinar "Analytical characterization of Crude Oil Separation" Part 1: DEMULSIFICATION

Attend this new LUM live webinar to get answers on the three demulsification key questions: how to quantify quickly and easily the kinetics, the amount and the quality of separated water in crude oil -water emulsions. Save energy, labour and decision time and run your demulsification tests either in real-time using the LUMiReader PSA or preferably accelerated using LUMiSizer or LUMiFuge state of the art analytical centrifuge devices.

This presentation reviews existing successful approaches and provides new data and insights into several aspects of crude oil demulsification. Demulsifier selection and dosage optimization, accelerated bottle test procedures with and without polymer form part of the presentation.
